

Tilt and the Photoelectric Effect and Its Impact on Solar Power Conversion Efficiency

Irene Alvarez Barajas and Areeya Dewitt

Abstract— Many factors impact the efficiency of solar panels such as tilt, the question is how and why. Previous research has indicated that there are optimal conditions for solar panels to boost efficiency. However, they do not specify how or why these factors boost efficiency. This study uses solar panels, a multimeter and a protractor to manipulate the tilt of the panels and observe the impact on the efficiency of the panels. It was found that the tilt impacts the path of the energy put into the panel and the efficiency of the panels. The research can be used to observe the photoelectric effect, the impact of tilt on solar panel efficiency and to engineer new technology having to do with solar panel energy conversion.

Keywords— Solar Power, efficiency, energy output, tilt, Photoelectric effect, and solar panels

I. INTRODUCTION

Solar power is a form of renewable energy that takes photons produced from the sun to stimulate electron flow, which is also known as electric current, with a solar panel. Theoretically, solar panels are a good source of energy due to the fact they are clean and use a renewable source. The reality of it is that they are inefficient as they usually only convert about 15-19% of the input to actual electrical power [1]. Many factors influence the efficiency of the solar panels, but this study will focus on how the tilt of the panels influence the efficiency of the solar power conversion. Studies such as Salih et al (2014) have observed the impact of tilt and other factors and output, identifying some of the optimal conditions for the solar panels [2]. While the study can be used to draw the inference of how tilt impacts efficiency, the methodology does not focus on the impacts of tilt itself and that holds true for many other studies as tilt is not the main focus of them. This study will focus on tilt's impact. The study will observe the relationship between the tilt and solar energy efficiency. It will also study the cause of why this happens.

II. METHODS

To obtain the measurements of solar input, we used a measurement from a solar energy website that predicts how much solar energy is released per

square meter. To obtain the measurement of the output, solar panel cells and a multimeter were used. The tilt was manipulated by measuring the angle of the solar panel to a table under it.

For the procedure, a solar panel would be held adjacent to a protractor and over a table to measure the tilt of the panel. It was plugged into a multimeter that measured the energy produced by the panels. We repeated the process for different angles and found the efficiency through converting the output to watts per meter squared like the input and dividing the output by input.

III. RESULTS AND DISCUSSION

Tilt (Degrees)	Voltage (Volts)	Current (Amps)	Wattage (Watts)	Power Input (w/m ²)	Watts/Meter squared (w/m ²)	Efficiency (%)
15.0	1.42 V	.010 A	.014 w	7020 w/m ²	5.8 x 10 ⁻³ w/m ²	8.3 x 10 ⁻⁶ %
30.0	1.52 V	.010 A	.015 w	7020 w/m ²	6.2 x 10 ⁻³ w/m ²	8.8 x 10 ⁻⁶ %
45.0	1.42 V	.020 A	.028 w	7020 w/m ²	1.2 x 10 ⁻² w/m ²	1.7 x 10 ⁻⁶ %
60.0	2.12 V	.030 A	.064 w	7020 w/m ²	2.6 x 10 ⁻² w/m ²	3.7 x 10 ⁻⁶ %
75.0	2.17 V	.090 A	2.0 x 10 ⁻¹ w	7020 w/m ²	8.0 x 10 ⁻² w/m ²	1.1 x 10 ⁻⁵ %
90.0	2.30 V	.010 A	.023 w	7020 w/m ²	9.4 x 10 ⁻³ w/m ²	1.3 x 10 ⁻⁶ %
105.	2.32 V	0.28 A	0.65 w	7020 w/m ²	2.7 x 10 ⁻¹ w/m ²	3.8 x 10 ⁻⁵ %
120.	2.34 V	0.36 A	0.84 w	7020 w/m ²	3.5 x 10 ⁻¹ w/m ²	5.0 x 10 ⁻⁵ %
